Bill,

I hope the below gets you what you need.

Alternate Water Supply Program at FNOP:

“Water supply wells currently included in the Alternate Water Supply Program have exhibited detections of TCE and/or RDX above the Final Target Groundwater Cleanup Goals during previous Water Supply Well Sampling Program events. Water supply wells currently not included in the Alternate Water Supply Program must exhibit detections of TCE and/or RDX above the Final Target Groundwater Cleanup Goals to be included in the Alternate Water Supply Program. If a water supply well that is not in the Alternate Water Supply Program contains a detection of TCE and/or RDX above the respective Final Target Groundwater Cleanup Goal, then a confirmation sample will be collected, and bottled water will be provided to the residence within three days. If TCE and/or RDX are confirmed to be at concentrations above the respective Final Target Groundwater Cleanup Goal, then that water supply well will be added to the Alternate Water Supply Program and either a GAC system will be installed within 90 days of receipt of the sample results or bottled water will be supplied (whichever the homeowner prefers).”

I have also include A figure from the 2020 annual report that all of the Water Supply Wells that are on our lists, the purple dots are the WSWs with out GAC or bottled water. The Green squares represent wells that are on the AWS program described above, there are about 8 of them.

Please let me know if you need any more info.

Jason
